## Basic Magnetic Mirror Machine:

### 0D-Modelling

- Assume Pastukhov-like losses along field lines
- Include classical perpendicular losses
- Include simple neutral and radiation model

# Small-Gyroradius Expansion

Assuming a steady-state, small-gyroradius, axisymmetric plasma, the lowest-order momentum equation is:

$$\mathbf{E} + \mathbf{u}_s \times \mathbf{B} = 0 \quad (1)$$

This implies that

$$\mathbf{E} = -\frac{d\Phi}{d\psi} \nabla \psi - \nabla \varphi, \quad \text{and} \quad \mathbf{u}_s = \mathbf{u} = \omega(\psi) R^2 \nabla \phi, \quad (2)$$

To next order in the gyroradius expansion

$$w_{\parallel} \mathbf{b} \cdot \nabla|_{\varepsilon} F_s = C[F_s], \quad \text{where} \quad \mathbf{w} = \mathbf{v} - \mathbf{u} \quad (3)$$

with the unique, confined, solution of a co-rotating Maxwellian:

$$F_s = N_s(\psi) \left( \frac{m_s}{2\pi T_s(\psi)} \right)^{3/2} \exp \left[ -\frac{m_s}{2T_s} (w^2 - \omega^2 R^2) - \frac{Z_s e}{T_s} \varphi \right], \quad (4)$$

**N.B.**  $N_s(\psi)$  is a pseudo-density that is a parameter of the Maxwellian. Not the particle density.

# Small-Gyroradius Expansion: Density and Quasineutrality

The density of this Maxwellian is given by

$$n_s = N_s(\psi) \exp \left[ \frac{m_s \omega^2 R^2}{2 T_s} - \frac{Z_s e}{T_s} \varphi \right] \quad (5)$$

We solve for the potential by equating electron and ion charge densities:

$$N_e \exp \left[ \frac{e \varphi}{T_e} + \frac{m_e \omega^2 R^2}{2 T_e} \right] = Z_i N_i \exp \left[ -\frac{Z_i e \varphi}{T_i} + \frac{m_i \omega^2 R^2}{T_i} \right], \quad (6)$$

This can be solved (employing  $m_e/m_i \ll 1$  and assuming  $Z = 1$  &  $T_e = T_i$ ) to give:

$$\varphi = \frac{m_i}{4 T_i} \omega^2 R^2, \quad (7)$$

and hence (on a mild redefinition of  $N_s$ ):

$$n_s = N_s \exp \left[ \frac{m_s \omega^2}{4 T_s} \left( R^2 - R_{\max}^2 \right) \right]. \quad (8)$$

# Small-Gyroradius Expansion: The Magnetic Equilibrium

Supersonic  
Equilibrium

Abel & Hassam

Introduction

The Equations of  
Collisionless  
Equilibrium

Rapidly Rotating  
Solution

Summary

With these formulae for  $\varphi$  and the variation of  $n_s$  along a field line in hand, we are left with the problem of determining the magnetic equilibrium, and hence the shape of the field lines.

This is done by solving the usual equations of force balance, with the addition of the centrifugal force:

$$-n_s m_s \omega^2 R \nabla R = -\nabla \left( p_i + p_e + \frac{B^2}{2\mu_0} \right) + \frac{1}{\mu_0} \mathbf{B} \cdot \nabla \mathbf{B} \quad (9)$$

**N.B.** We choose not to solve a Grad-Shafranov equation, although one could easily be written for  $\psi$ .

# Ordering

Supersonic  
Equilibrium

Abel & Hassam

Introduction

The Equations of  
Collisionless  
Equilibrium

Rapidly Rotating  
Solution

Summary

We will solve the equilibrium equation asymptotically, under the following assumptions:

- The plasma is rapidly rotating  $M = u/c_s \gg 1$ .
- The plasma thermal energy is small compared to the rotational energy  $T_i \ll m_i u^2$
- The line-average rotational energy is comparable to the magnetic energy  $m_i \bar{n}_i \omega^2 R \sim B^2 / 2\mu_0$

Thus, the solution will be low  $\beta$  and have an **Alfvén Mach Number**  $M_A$  of order unity. We also assume reflection symmetry in the vertical plane  $z = 0$ .

# Layer Solution: 1

Supersonic  
Equilibrium

Abel & Hassam

Introduction

The Equations of  
Collisionless  
Equilibrium

Rapidly Rotating  
Solution

Summary

Dropping terms small in  $\beta$ , we have to solve

$$m_i N_i \exp \left[ \frac{m_s \omega^2}{2 T_s} (R^2 - R_{\max}^2) \right] \omega^2 R \nabla R = - \nabla \frac{B^2}{2 \mu_0} + \frac{1}{\mu_0} \mathbf{B} \cdot \nabla \mathbf{B}, \quad (10)$$

we expect the rapid rotation to localise the density into a disc-like layer near the midplane (i.e at  $z = 0$ ). Making the assumption that the density localises and that gradients in  $z$  dominate over gradients in  $R$ , we have to solve for a field that balances centrifugal forces and magnetic tension in the radial direction:

$$m_i N_i \exp \left[ \frac{m_s \omega^2}{2 T_s} (R^2 - R_{\max}^2) \right] \omega^2 R = \frac{1}{\mu_0} B_z \frac{\partial B_R}{\partial z} \quad (11)$$

## Layer Solution: 2

Supersonic  
Equilibrium

Abel & Hassam

Introduction

The Equations of  
Collisionless  
Equilibrium

Rapidly Rotating  
Solution

Summary

Introducing the field line shape as  $R = R(\psi, z)$  we can write this as an equation for  $R$ :

$$m_i N_i \exp \left[ \frac{m_s \omega^2}{2 T_s} (R^2 - R_{\max}^2) \right] \omega^2 R = \frac{1}{\mu_0} B_z \frac{\partial}{\partial z} \left( B_z \frac{\partial}{\partial z} \Big|_{\psi} R \right). \quad (12)$$

To reduce the complexity of the system, we note that

$$\nabla \cdot \mathbf{B} = \frac{\partial B_z}{\partial z} + \frac{\partial B_R}{\partial R} \approx \frac{\partial B_z}{\partial z} = 0, \quad (13)$$

and so  $B_z$  is constant (with respect to  $z$ ) inside the layer. Then, we observe that

$$\begin{aligned} B_z \frac{\partial}{\partial z} \Big|_R &= B_z \frac{\partial}{\partial z} \Big|_{\psi} - B_z \frac{\partial R}{\partial z} \Big|_{\psi} \frac{\partial}{\partial R} \Big|_z \\ &= B_z \frac{\partial}{\partial z} \Big|_{\psi} - B_R \frac{\partial}{\partial R} \Big|_z \approx B_z \frac{\partial}{\partial z} \Big|_{\psi} \end{aligned} \quad (14)$$

## Layer Solution: 3

Supersonic  
Equilibrium

Abel & Hassam

Introduction

The Equations of  
Collisionless  
Equilibrium

Rapidly Rotating  
Solution

Summary

Hence we have an equation purely along the field line:

$$m_i N_i \exp \left[ \frac{m_s \omega^2}{2 T_s} (R^2 - R_{\max}^2) \right] \omega^2 R = \frac{1}{\mu_0} \left( B_z^2 \frac{\partial^2}{\partial z^2} \Big|_{\psi} R \right). \quad (15)$$

Simplifying by assuming that  $R$  changes only by a small amount inside the layer, we write

$$R \approx R_{\max}(\psi) - \delta R \quad (16)$$

we can solve to find that

$$\delta R = \frac{R_{\max}}{2M^2} \ln \left[ \cosh \left( 8M^2 \lambda \frac{z}{R_{\max}} \right) \right], \quad (17)$$

with  $M = \omega R_{\max} / c_s$  and

$$\lambda = \left( \frac{4}{M^2} \frac{N_i m_i \omega^2 R_{\max}^2}{B_z^2 / 2\mu_0} \right)^{1/2} \quad (18)$$

# Layer Solution: 4

Supersonic  
Equilibrium

Abel & Hassam

Introduction

The Equations of  
Collisionless  
Equilibrium

Rapidly Rotating  
Solution

Summary

Consequences of this solution:  
We can now calculate the density profile:

$$n_i = N_i \operatorname{sech}^2 \left( 8M^2 \lambda \frac{z}{R_{\max}} \right) \quad (19)$$

and calculate the field-line-averaged  
density  $\bar{n}_i$  in terms of  $N_i$  to finally  
eliminate  $N_i$ :

$$N_i = \frac{\bar{n}_i}{R_{\max}} M^2 \bar{M}_A^2, \quad (20)$$

where the average Alfvén Mach number  
is

$$\bar{M}_A^2 = \frac{\bar{n}_i m_i \omega^2 R_{\max}}{B_z^2 / 2\mu_0} \quad (21)$$

# Exterior Solution

Supersonic  
Equilibrium

Abel & Hassam

Introduction

The Equations of  
Collisionless  
Equilibrium

Rapidly Rotating  
Solution

Summary

Now we need to solve outside the layer. Thankfully, our solution for  $n_i$  is such that it becomes a delta function (consistent with our assumptions). The current layer due to the plasma is

$$J_\phi = [B_R]_{0-}^{0+} = 8\lambda B_z \quad (22)$$

## Greens Function

For a current layer at  $z = 0$ :

$$G(R, z, R') = \frac{1}{2\pi} \sqrt{(R + R')^2 + z^2} \left[ (1 - k^2) K(k) - E(k) \right] J_\phi \quad (23)$$

Giving

$$\psi(R, z) = \psi^{\text{coil}} + \int_a^b G(R, z, R') J_\phi(R') dR' \quad (24)$$

**Integral Equation for  $\psi$ . Iterate the solution to find consistent  $\psi$  &  $B_z$**
